IN THE CLAIMS

Please replace claims 3-7 and 11-13 with the following rewritten claims:

- 3. (Amended Once) The method of claim 6 wherein the step of transforming each group of unencoded signals into a group of encoded signals comprises the step of transforming a group of unencoded signals into a group of encoded signals having an equal number of logic 1's and logic 0's using one of the selected at least one encoding scheme.
- 4. (Amended Once) The method of claim 7 wherein the step of transforming each group of unencoded signals into a group of encoded signals comprises the step of transforming a group of six unencoded signals into a group of eight encoded signals.
- 5. (Amended Once) The method of claim 7 wherein the step of transforming each group of unencoded signals into a group of encoded signals comprises the step of transforming a group of four unencoded signals into a group of six encoded signals.
- 6. (Amended Once) The method of claim 1 further comprising the step of selecting at least one encoding scheme prior to performing the step of transforming each group of unencoded signals into a group of encoded signals.

7. (Amended Once) The method of claim 6 wherein the at least one encoding scheme transforms a group of unencoded signals to encoded signals such that a difference between a total number of unencoded data values and a total number of encoded data values is a predetermined fraction of the total number of unencoded data values

11. (Amended Once) The method of claim 12 wherein the step of transforming each group of unencoded signals into a group of encoded signals comprises the step

N

of transforming a group of unencoded signals into a group of encoded signals having a constant number of logic 1's and logic 0's using one of the selected at least one encoding scheme.

Ant

- 12. (Amended Once) The method of claim 9 further comprising the step of selecting at least one encoding scheme prior to performing the step of transforming each group of unencoded signals into a group of encoded signals.
- 13. (Amended Once) The method of claim 12 wherein the at least one encoding scheme transforms a group of unencoded signals to encoded signals such that a difference between a total number of unencoded data values and a total number of encoded data values is a predetermined fraction of the total number of unencoded data values.

Please add the following new claims 15-34.

15. (New) An apparatus for inter-node communication, comprising:

means for dividing a plurality of unencoded signals into groups at a first node, wherein each group has a number of unencoded signals;

13

means for transforming each group of unencoded signals into a group of encoded signals, wherein each group of encoded signals has nearly an equal number of logic 1's and logic 0's; and

means for transmitting the groups of encoded signals to a second node, whereby the groups of encoded signals are transmitted with minimal current fluctuations.

- 16. (New) The apparatus of claim 15 further comprising means for selecting at least one encoding scheme prior to transforming each group of unencoded signals into a group of encoded signals.
- 17. (New) The apparatus of claim 16 wherein the at least one encoding scheme transforms a group of unencoded signals to encoded signals such that a difference between a total number of unencoded data values and a total number of encoded data values is a predetermined fraction of the total number of unencoded data values.
- 18. (New) The apparatus of claim 16 wherein the means for transforming each group of unencoded signals into a group of encoded signals comprises means for transforming a group of unencoded signals into a group of encoded signals having an equal number of logic 1's and logic 0's using one of the selected at least one encoding scheme.
- 19. (New) The apparatus of claim 17 wherein the means for transforming each group of unencoded signals into a group of encoded signals comprises means for transforming a group of six unencoded signals into a group of eight encoded signals.
- 20. (New) The apparatus of claim 17 wherein the means for transforming each group of unencoded signals into a group of encoded signals comprises means for transforming a group of four unencoded signals into a group of six encoded signals.
- 21. (New) The apparatus of claim 15 further comprising means for transforming the groups of encoded signals received by the second node back into the plurality of unencoded signals.

22. (New) An apparatus for inter-node communication, comprising:

means for dividing a plurality of unencoded signals into groups at a first node, wherein each group has a number of unencoded signals;

means for transforming each group of unencoded signals into a group of encoded signals, wherein each group of encoded signals has nearly a constant number of logic 1's and logic 0's; and

means for transmitting the groups of encoded signals to a second node, whereby the groups of encoded signals are transmitted with minimal current fluctuations.

23. (New) The apparatus of claim 22 further comprising means for selecting at least one encoding scheme prior to transforming each group of unencoded signals into a group of encoded signals.

24. (New) The apparatus of claim 23 wherein the at least one encoding scheme transforms a group of unencoded signals to encoded signals such that a difference between a total number of unencoded data values and a total number of encoded data values is a predetermined fraction of the total number of unencoded data values.

25. (New) The apparatus of claim 23 wherein the means for transforming each group of unencoded signals into a group of encoded signals comprises means for transforming a group of unencoded signals into a group of encoded signals having a constant number of logic 1's and logic 0's using one of the selected at least one encoding scheme.

26. (New) The apparatus of claim 22 further comprising means for transforming the groups of encoded signals received by the second node back into the plurality of unencoded signals.

27. (New) A computer-useable medium including computer program code for causing a computer to effect inter-node communication by performing the steps of:

dividing a plurality of unencoded signals into groups at a first node, wherein each group has a number of unencoded signals;

transforming each group of unencoded signals into a group of encoded signals, wherein each group of encoded signals has nearly an equal number of logic 1's and logic 0's, and

transmitting the groups of encoded signals to a second node, whereby the groups of encoded signals are transmitted with minimal current fluctuations.

- 28. (New) The computer-useable medium of claim 27 further comprising computer program code for causing a computer to effect inter-node communication by performing the step of selecting at least one encoding scheme prior to transforming each group of unencoded signals into a group of encoded signals.
- 29. (New) The computer-useable medium of claim 28 wherein the step of transforming each group of unencoded signals into a group of encoded signals comprises the step of transforming a group of unencoded signals into a group of encoded signals having an equal number of logic 1's and logic 0's using one of the selected at least one encoding scheme.
- 30. (New) The computer-useable medium of claim 27 further comprising computer program code for causing a computer to effect inter-node communication by performing the step of transforming the groups of encoded signals received by the second node back into the plurality of unencoded signals.

31. (New) A computer-useable medium including computer program code for causing a computer to effect inter-node communication by performing the steps of:

dividing a plurality of unencoded signals into groups at a first node, wherein each group has a number of unencoded signals;

transforming each group of unencoded signals into a group of encoded signals, wherein each group of encoded signals has nearly a constant number of logic 1's and logic 0's; and

transmitting the groups of encoded signals to a second node, whereby the groups of encoded signals are transmitted with minimal current fluctuations.

- 32. (New) The computer-useable medium of claim 31 further comprising computer program code for causing a computer to effect inter-node communication by performing the step of selecting at least one encoding scheme prior to transforming each group of unencoded signals into a group of encoded signals.
- 33. (New) The computer-useable medium of claim 32 wherein the step of transforming each group of unencoded signals into a group of encoded signals comprises the step of transforming a group of unencoded signals into a group of encoded signals having a constant number of logic 1's and logic 0's using one of the selected at least one encoding scheme.
- 34. (New) The computer-useable medium of claim 31 further comprising computer program code for causing a computer to effect inter-node communication by performing the step of transforming the groups of encoded signals received by the second node back into the plurality of unencoded signals.
